

Visible, Long-Lasting Effects after Only a Few Sessions

It is now possible to care for your skin without subjecting it to traumas or long, invasive treatments. The pulsed light generates a lifting effect by naturally stimulating the production of collagen and improving skin tone and glow. Minisilk FT is similarly effective in treating superficial vascular lesions and sun age-related skin imperfections, and in the progressive removal of superfluous hair. The benefits are evident after only a few sessions.

**Eliminate Superfluous Hair Without
Becoming Slave to Creams and Waxing**

Power and fractioned pulse: the right technology for every phototype

PULSED LIGHT FOR ALL YOUR NEEDS

From **hair removal** to **vascular** and **pigmentary rejuvenation**: DEKA's answer to all your skin imperfections is based on advanced, high-performance technologies, always in complete safety and without any thermal damage to the surrounding areas.

FRACTIONED PULSE: SPEED AND EFFECTIVENESS FOR EVERY SKIN TYPE

The selection of the most suitable wavelength range for the phototype and application guarantees greater light absorption by the melanin in the hair or skin spots, even in darker phototypes.

The beneficial light energy of **Minisilk FT** can be divided into three pulses: an indispensable feature for easy removal of superfluous hairs or skin spots, even in melanin-rich skins. The segmented pulses make it possible to use much higher fluences while protecting the skin from thermal damage. The physician can select the duration and energy of each individual pulse: an intelligent technology designed to protect the patient's skin.

SMOOTH SKIN IN NO TIME AT ALL

One of the advantages of pulsed light is the speed of treatment. This is even more evident in the case of **Minisilk FT** with its broader handpiece emission surface, one of the largest on the market. The result is faster treatment speed, facilitating hair removal even on large areas such as the chest, legs, or back, which can be performed more rapidly and in total safety.

Progressive hair removal with **Minisilk FT** on every type of hair, skin and phototype, is a painless and lasting treatment that reduces the number of sessions and slows down hair regrowth.

TARGETED ACTION ON SKIN IMPERFECTIONS

Pigmentary lesions, superficial vascular lesions, couperose, rosacea, enlarged pores, acne, age spots: **Minisilk FT** acts on a series of imperfections all over the body without harmful effects, even on more delicate areas such as the face, neck and throat. Improvements are already visible after four or five sessions and become more and more evident over the following months.

MINI-INVASIVE LIFTING EFFECT WITH SHORT RECOVERY TIME

Significant aesthetic results will already be visible after a variable cycle of sessions.

As a result of its speed and precision, **Minisilk FT** gives the skin a trauma-free and scalpel-free general lifting effect with short recovery times. The pulsed light stimulates the production of new collagen and improves skin tone, texture and glow.
